

COVENANT ADEOGO

Computer Engineer | Full-Stack & Backend Systems

Osun State, Nigeria | +234 9129408866 | adeogocovenant@gmail.com | [linkedin.com/in/covenantadeogo](https://www.linkedin.com/in/covenantadeogo) | github.com/Cinioluwa | covenantadeogo.vercel.app

EXPERIENCE

Application Developer Intern — NNPC Limited

Mar 2026 – Present | Abuja, Nigeria (On-site)

Tech Lead & full-stack developer on Forge, an internal multi-tenant platform unifying deployment status, app cataloguing, and risk tracking; leads a 4-person team, each owning a module.

- **Monolith refactor:** broke a ~2,000-line monolithic Next.js SST file into 5 modular microservices, using lazy loading to break circular dependencies and resolve compilation bottlenecks.
- **CMDB automation:** built a pipeline that ingests repo metadata, CVEs (via OSV.dev), and dependencies from GitHub and Azure DevOps via webhooks/APIs, eliminating manual data entry.
- **Security gatekeeping:** blocked a PR carrying critical database vulnerabilities and separately caught an ORM migration that would have dropped core production tables.
- **Cloud-target architecture:** designing a dual-model AI agent for autonomous overnight codebase scanning, targeting Azure AI Foundry and SignalR, validated locally ahead of a planned Azure migration.
- **Stack:** Next.js, PostgreSQL, Drizzle ORM, Redis, Clerk, Vercel/Supabase.

Backend Engineering Intern — Rekodi (Word Sound)

Apr 2026 – Present | Remote

Concurrent remote internship alongside NNPC. High-concurrency streaming/media app; informally leads the intern engineering cohort.

- **Team lead (intern cohort):** audits and manages ~70 Agile user stories in Jira across 4 developers (team at 60% completion); personally assigned 18, 16 complete.
- **CI/CD recovery:** diagnosed a corrupted pipeline caused by a flawed Drizzle ORM “full-reset” migration — wrote custom incremental SQL and bypassed a failing RunPod integration test to restore green builds.
- **Security audit:** found and patched 9 RBAC vulnerabilities enabling cross-tenant data mutation; enforced JWT auth and fixed a cron-worker bug causing spam pushes.
- **Performance:** eliminated N+1 queries, cutting core API response times to sub-50ms on Render; introduced PR-stacking practice for the team.
- **Media architecture:** designing a low-latency HLS delivery path (AWS CloudFront/S3) decoupled from serverless timeouts — dev/test mocks AWS/Azure locally via Ministack ahead of production migration.

Founding Backend Engineer — Echo

Oct 2025 – Present

- Built the backend architecture from scratch for a multi-tenant feedback & issue-governance platform — CI/CD pipelines, database schema design, and core API layer, as co-founder.
- Helped the team reach 4th place in the Covenant University Hult Prize.

Technical Lead, Ascension Cup 2025 — Covenant University

Aug – Sep 2025

- Engineered GemJudge v2, a deterministic Python/Pytest judging system that cut a 2-day scoring cycle to 2 hours for 28+ participants, with Gemini API integration for real-time ranking and feedback.

Lead Web Developer — Tripledots Technologies

Jul – Sep 2025 | Remote

- Led the company website redesign from Figma to production and mentored peers on a reusable component system.

KEY PROJECTS

GemJudge (AI Hackathon Evaluator) — Python, CustomTkinter, Gemini API

- Desktop app using an LLM to automate code evaluation with real-time streaming feedback for judges.

Echo — Multi-Tenant Feedback & Issue-Governance Platform | Node.js, Express, TypeScript, PostgreSQL (Prisma), Redis, Socket.IO, Docker

- **Multi-tenancy & governance:** architected data isolation across institutions with Prisma/PostgreSQL, plus a 4-tier RBAC system (User/Representative/Admin/Super Admin) secured via JWT and Google OAuth, with org claim-and-verification workflows.
- **Real-time layer:** built live issue-stream updates with Socket.IO and a Redis adapter for horizontal scaling, backed by custom Redis caching middleware with tag-based invalidation for personalized feeds.
- **Core product:** shipped the social layer — issue posts, collaborative solution threads, nested comments, upvotes — plus an anonymous posting system with abuse-prevention safeguards.
- **API hardening & QA:** Zod request validation, rate-limiting, Helmet/CORS, bcrypt, structured logging, and a 3-layer test suite (Vitest/Supertest with Testcontainers, Playwright E2E) with OpenAPI/Swagger docs.

TECHNICAL SKILLS

Languages: Python, Java, JavaScript (ES6+), TypeScript, SQL, HTML5, CSS3, C
Backend & Cloud: Node.js, Next.js, Express, PostgreSQL, MongoDB, Prisma & Drizzle ORM, Redis, Socket.IO, Docker, Firebase, REST APIs
Frontend: React, Expo (React Native), JavaFX, CustomTkinter, Tailwind CSS, Figma
Tools & Practices: Git/GitHub, Jira, Vitest, Pytest, Pandas, QGIS, Gemini API, Proteus, Azure

EDUCATION

B.Eng. Computer Engineering — Covenant University, Ota, Ogun State | CGPA: 4.94/5.00 | 2022 – Present
Relevant coursework: Web Programming, Databases, Data Structures & Algorithms, Embedded Systems, Circuit Theory.

LEADERSHIP & COMMUNITY

- Hult Prize 2026 — Campus Finalist, 4th place.
- Cowrywise Campus Ambassador (Dec 2025 – Present).
- Member, Hebron Startup Lab (Jun 2024 – Present) and GDG on Campus: Covenant University (Sep 2023 – Present).
